

Posterior probability

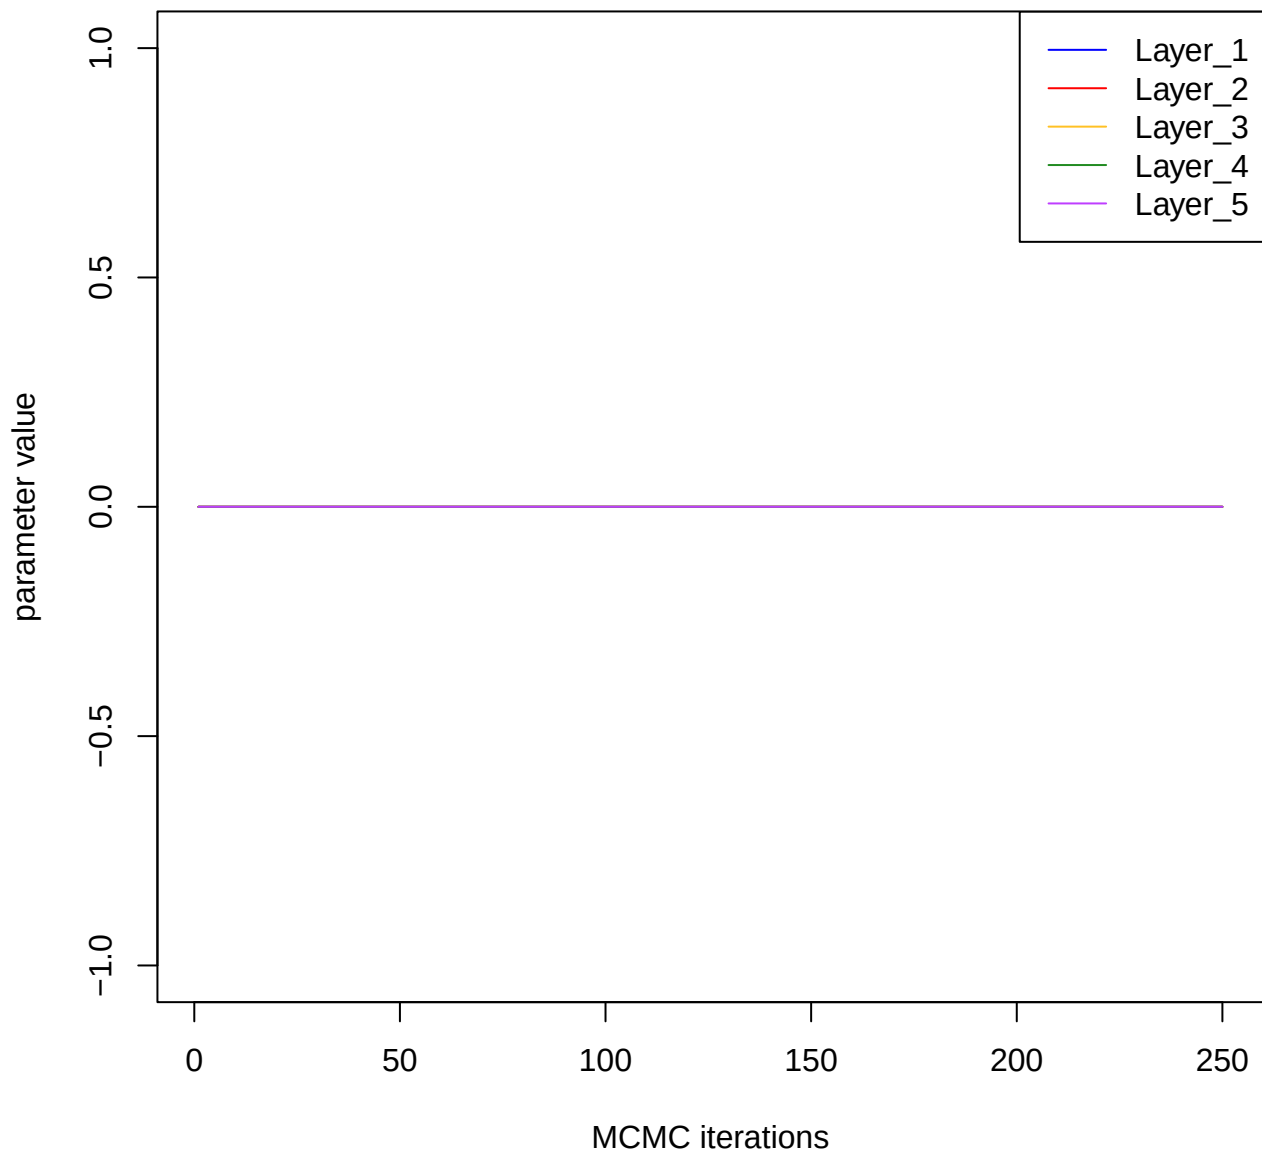

The figure displays a dense collection of time-series signals plotted against a horizontal axis ranging from 0 to 250. The signals are represented by lines of various colors, including red, magenta, green, cyan, blue, and black. Some lines are solid, while others are dashed. The plot is characterized by high-frequency, high-amplitude oscillations. A notable feature is a change in the signal characteristics around time 100, where the signals become more complex and their amplitudes generally increase. The overall appearance is that of a noisy, multi-component system being monitored over time.
